

CANDY DIALOGUE CREATOR

Custom Presets

1.0.0

Custom Presets allow you to quickly insert lines, with pre-filled data, into a Block.

Creating Presets

To create Custom Presets, first navigate to the Conversation named "CUSTOM_PRESETS".

In that Conversation, create a new Block. Name the Block with the following format:

[category]preset name

The name is important as it dictates how the Preset is displayed in the UI.

For example, if you name a Block "[Characters]Alice", it will create a button labeled "Alice", under a category labeled "Characters".

Inside the Block, add any lines you want, and fill in the data you want.

From that point on, anytime you insert that Preset in a Block, it will insert the same lines, with the same data.

Inserting Presets

To insert presets, look at the left-side margin of the Main UI, where the buttons for inserting lines are. At the top, click the "Preset" button to switch to the list of presets.

Click any Preset button, and it will immediately insert the lines for that Preset.

The same keyboard shortcuts work as for inserting regular lines.

Technical Details

The CUSTOM_PRESETS Conversation is never exported with dialogues. Instead, it is saved to the Candy Dialogue Creator profile that creates them.

If you want to copy or transfer Presets between profiles, simply navigate to the main "Candy Dialogue Creator" folder → "Profiles" folder.

In the "Profiles" folder, open the folders for the profiles you want to copy presets from/to.

Inside each profile's folder, open Config.json in a text editor, and look for the "custom_presets" dictionary. Copy or paste any presets you desire from/to that dictionary.

Ensure you save the Config.json correctly, and close it.

As a precaution, make a backup of the Config.json files, in case you accidentally damage the formatting. These Config.json files save your entire profile settings, so it could be very inconvenient if you made an error and didn't know how to fix it.

Also, ensure that you don't have multiple presets with the same name and category!

"[Characters]Alice" and "[Actors]Alice" will work, but two Presets named "[Characters]Alice" will conflict. If multiple presets with the same name already exist, rename them.

In the future, we may add a feature to transfer presets between profiles through the Candy Dialogue Creator. Since Candy Dialogue Engine and Candy Dialogue Creator have just released, we're focusing on ensuring everything works properly before adding more features.

As an alternative, it should be easy for any users to create such a tool or script themselves, since it's just a matter of copying data from a .json file to another.
