

CANDY DIALOGUE CREATOR

File Conversion

1.1.0

Dialogues, save files and presets made in version 1.0 will need to be converted in order to work in version 1.1. This can be done with the Converter tool built into Candy Dialogue Creator.

Dialogues

1. **Make a backup of your 1.0 dialogues!** The Converter makes backups automatically, but it's safer to make your own backups too.
2. In the Main UI, click the main menu icon in the top-left corner: ≡
3. Select "Convert Dialogues". A file dialogue window will open.
4. Navigate to the folder containing your dialogues (You should know where you exported dialogues in 1.0: probably Candy_DE/Dialogues, inside your Godot project folder).
5. Select the dialogue files you want to convert. NOTE: Select only 1.0 files, not 1.1 files, or the conversion will abort.

The Converter will make backup copies of the 1.0 files inside a custom folder, with the date and time. It will also replace the 1.0 files with 1.1 files. The new 1.1 files will have the same name as the old 1.0 files: this way, your project can immediately use them.

As an extra convenience, Candy DC 1.1 automatically imports languages/variants to your profile when you load or import a dialogue. If your dialogues had multiple languages or variants, you don't need to manually add them again to your profile in Candy DC 1.1: just load/import the dialogues at least once.

Important: We tested the Converter, but bugs are always possible!

- Please keep backups of your 1.0 dialogues until you are certain the converted files are fine.
- Test the converted files in Candy Dialogue Engine, or import them to Candy DC 1.1 to look at the Lines and their data.
- **If you notice any errors or problems, let us know immediately:**
Open an issue on [Github](#), post on our [Github discussions](#), send us a message through our contact page on our [website](#)... Whatever you prefer.
Errors with the Converter are serious and we need to fix them immediately, before other users are affected.

Saves

You also need to update your Candy DC 1.0 save files to 1.1. The Converter can be used to convert manual saves, quick saves and auto saves.

The process is the same as for upgrading dialogues, except you must select the "Convert Saves" option in the main menu.

By default, the Save Converter should open to the folder where 1.0 profiles are stored. Select a profile's folder, then go to the "Saves" folder:

`*/Candy Dialogue Creator/Profiles/<profile name>/Saves`

Save Paths

In 1.0, save files were stored to:

`user://Profiles/<profile name>/Saves`

In 1.1, save files are stored to:

`user://Users/<user name>/<profile name>/Saves`

The actual paths on disk for the 'user://' folder are the following:

Linux:

`/home/<your username>/.local/share/godot/app_userdata/Candy Dialogue Creator/`

Windows:

`C:/Users/<your username>/AppData/Roaming/Godot/app_userdata/Candy Dialogue Creator/`

MacOS:

`/Users/<your username>/Library/Application Support/Godot/app_userdata/Candy Dialogue Creator/`

Note that some folders in these paths are likely hidden by default!

You can either change your settings to show hidden files and folders, or copy/paste the paths above into your file browser's address bar.

You don't need to make backups of your original save files: the Converter does not modify or delete them.

The Converter will automatically create new save files and backups of the 1.0 files to your Candy DC 1.1 profile folder. However, these files will be placed in a folder named "Converted": you will need to manually move them to the Auto_Saves, Manual_Saves or Quick_Saves folders.

To clarify, the "Converted" folder's path is:

user://Users/<user name>/<profile name>/Saves/Converted

Converted save files need to be placed in the following folders:

user://Users/<user name>/<profile name>/Saves/Auto_Saves

user://Users/<user name>/<profile name>/Saves/Manual_Saves

user://Users/<user name>/<profile name>/Saves/Quick_Saves

Presets

You can import your old Candy Dialogue Creator Presets from 1.0 to 1.1 (if you made any).

The procedure is similar to upgrading dialogues and saves:

1. In the main menu, select the "Convert Presets" option.
2. A file dialogue window will open: select the folder of the 1.0 profile that contains the presets you want to import.
3. Select the file named "config.json".

This will copy the presets in your 1.0 profile and save them as profile presets in your 1.1 profile.

If a preset with the same name exists in both the 1.0 profile and your 1.1 profile, it will be imported with '(1.0)' as a suffix, to avoid overwriting the existing preset. Presets that don't exist in your 1.1 profile don't have that suffix.

The Converter doesn't just import presets: it also converts data between 1.0 and 1.1 dialogue format if needed. That means, after importing, you don't need to go over the presets and update them.

You don't need to make a backup of config.json: the Converter does not modify or delete it.
