

CANDY DIALOGUE ENGINE

Basic Setup Guide

1.0.2

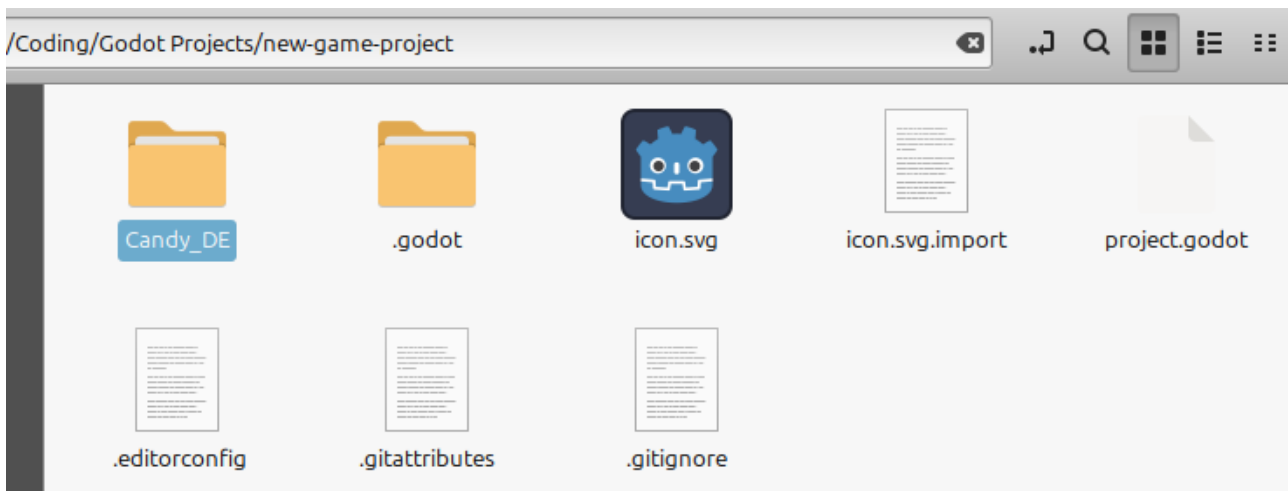

This guide describes how to quickly install and setup Candy DE for simple dialogues. For advanced features, see the advanced guides.

If you haven't done it already, download and unpack (unzip) Candy Dialogue Engine and the Candy Dialogue Creator.

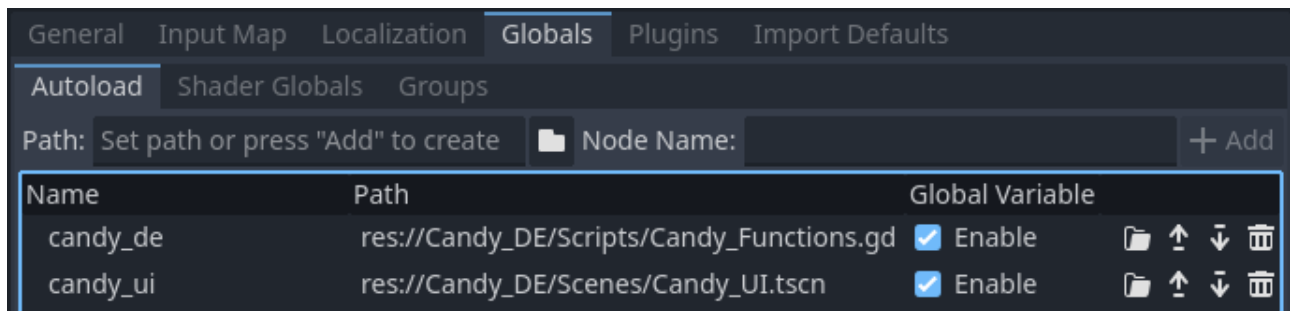

1. Candy DE Installation

During this process, ignore UID warnings and script parse errors: these are normal until the installation process is complete. Errors and warnings should only be a concern if they persist after completing step 4.

1. Place the 'Candy_DE' folder inside your Godot project's main folder.

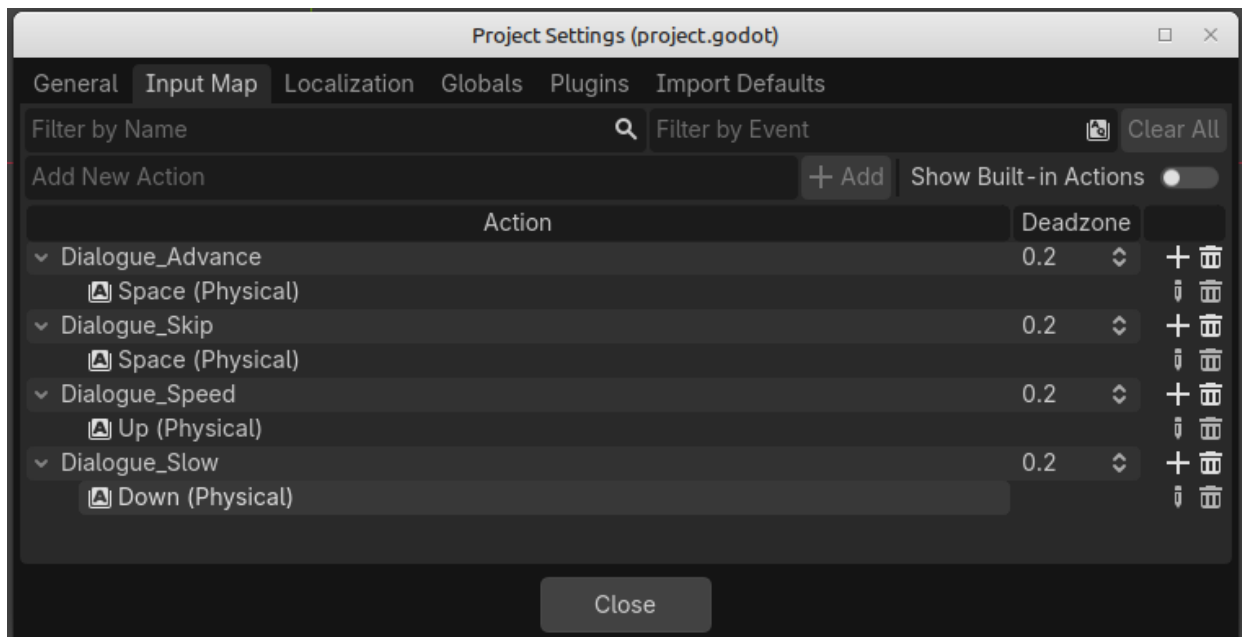

2. At the top of the Godot Editor: 'Project' → 'Project Settings' → 'Globals' tab → 'Autoload tab':

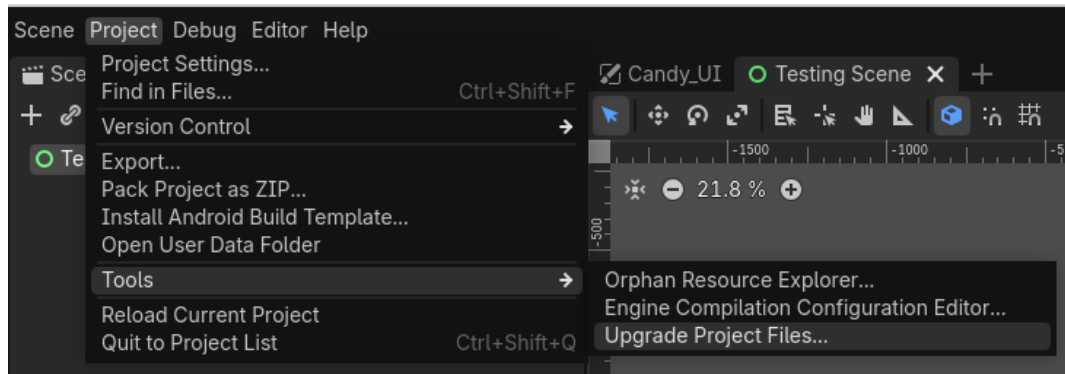

- Add ***Candy_Functions.gd***
 - Give it the name (prefix) "candy_de", in lowercase only.
- Add ***Candy_UI.tscn***
 - Give it the name (prefix) "candy_ui", in lowercase only.
- Make sure "Enabled" is ticked for both.

3. In 'Project Settings' → 'Input Map':

- Add an action named "Dialogue_Continue".
 - Assign it any key you want (recommend Enter, Space and/or Mouse 1).
- Add 3 actions named "Dialogue_Skip", "Dialogue_Speed" and "Dialogue_Slow".
 - These actions are used with the typewriter effect, to make text display instantly (Dialogue_Skip), write faster (Dialogue_Speed) or write slower (Dialogue_Slow).
 - You don't need to assign keys to them if you don't want to use them, but the actions should be added to the Input Map anyway to avoid error warnings.
 - These actions must use different keys. One of them can use the same key as "Dialogue_Continue".

4. At the top of the Godot Editor: 'Project' → 'Tools' → 'Upgrade Project Files...'

• R
e
l

oad the Godot Editor if prompted to do so.

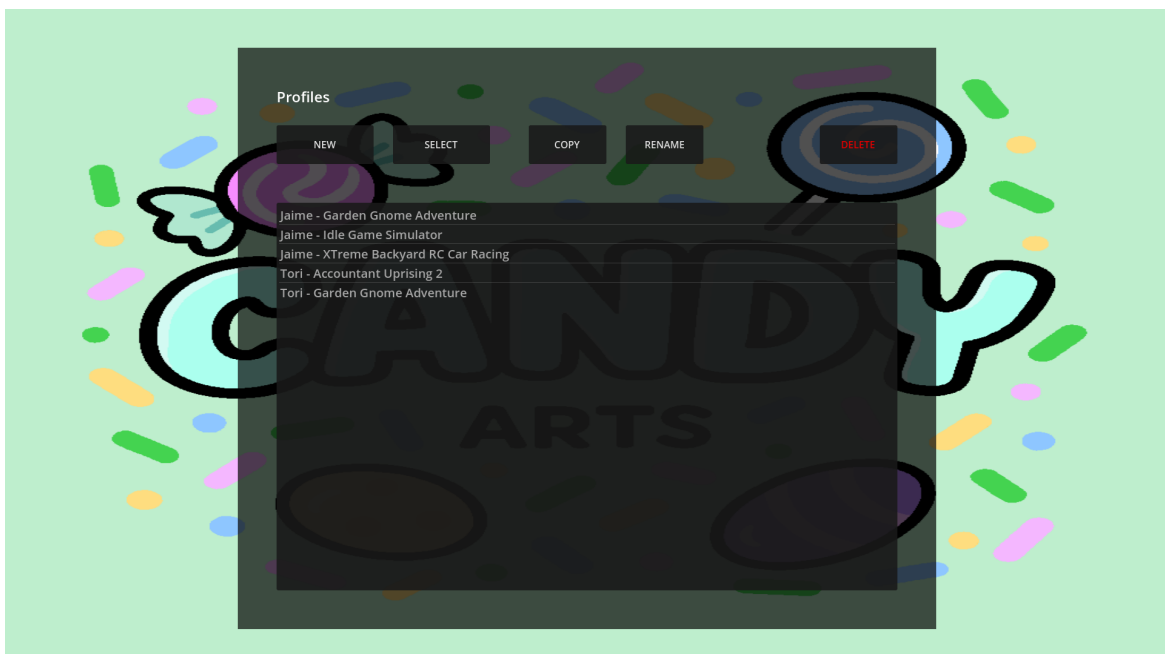

- This will avoid/fix UID issues.

That's it, Candy DE already works with its default settings!

Now let's setup the standalone Candy Dialogue Creator. You can keep the Godot Editor open in the background.

2. Candy DC Installation

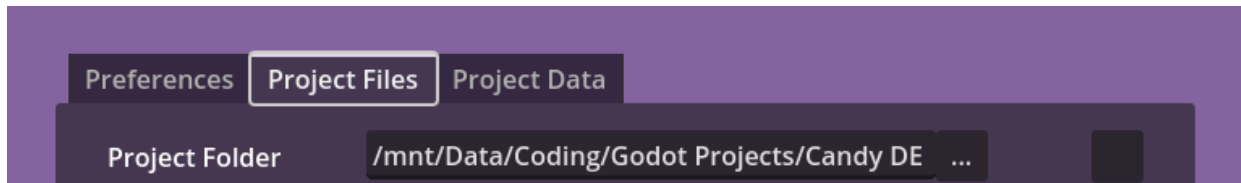

1. Launch the Candy Dialogue Creator executable for your operating system.
2. In the profile selection menu that shows up:

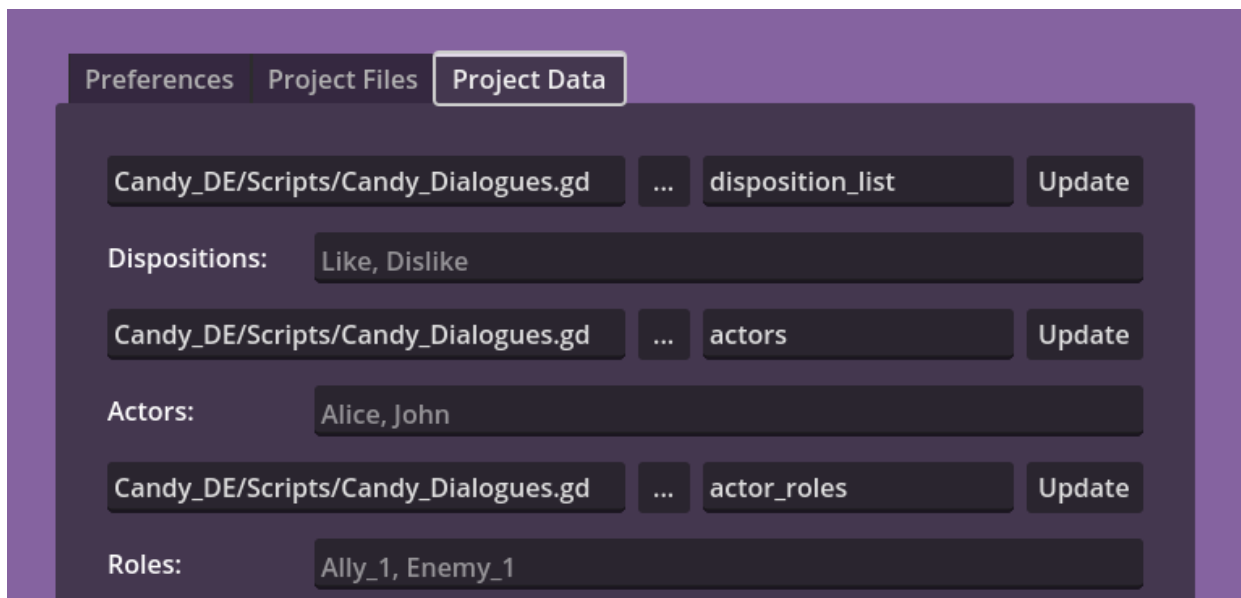

- Click "New" to create a new profile.
- Type a profile name that refers to your Godot project and yourself (e.g. "Jaime - Garden Gnome Adventure").
- Click on the new profile in the list, then click "Select".

3. In the editor screen:

- Click the main menu (≡) button in the top-left corner:
- When the main menu appears, click "Settings"
- In the "Preferences" tab:
 - If you are color-blind, set "Color Mode" to 1.
- In the "Project Files" tab:

- Copy/paste the path of your Godot project in "Project Folder", or click the "..." button to browse to it.
- In the "Project Data" tab:

- Click the three "Update" buttons.
 - If you've correctly provided the path to your project folder earlier, and you've placed the Candy_DE folder in the right location, notice it imports some default data from your the Candy DE scripts in your Godot project.
- Click "Close" at the bottom of the settings menu, then "Close Menu" at the bottom of the main menu.

Ignore the other settings and options for now, this is all you need to get started.

To learn how to create your first dialogue, open the Basic Dialogue Guide.
