Dialogue Save/Load

1.0.0

Saving and loading allows you to quickly save and restore your work-in-progress. Several options are provided:

Saving

Multiple saving methods are provided:

Manual Save → Manually select a file to save to.

Incremental Save → A form of manual save, which doesn't overwrite the last opened manual save. Instead, a new file is created, with the same name, but with the current date and time appended to it.

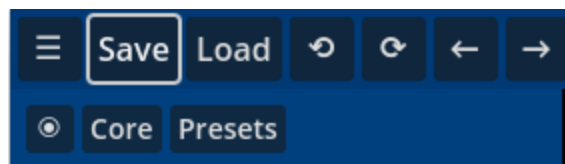

Quick Save → A save performed instantly by pressing the F4 key.

Auto Save → An automatic save, performed at regular time intervals as a precaution.

Note that each user/project profile has its own save files. Therefore, quick saves and auto saves performed by one profile can't overwrite those of another profile.

Manual Save

Manual saving is performed by right-clicking or left-clicking the "Save" button at the top of the Main UI:

Left-clicking the button will immediately save to the last loaded *manual* save file. If no save file was loaded, or if the last loaded file was an *auto* save or a *quick* save, you will be prompted to select a file to save to (or to create a new one).

If you right-click the "Save" button, you will be offered three options:

Save → Saves to the last loaded file if it was a manual save.

Save As → Allows you to select a file to save to (or to create a new one).

Save Incremental → Creates a new save file, using the name of the last loaded manual file, but adding the save time and date to it. If the last loaded file was not a manual save, you will be prompted to select a manual save or enter a file name; if you select a manual save file, a new file with the same name and the time and date appended will be created; if you choose to enter a file name, a new save file will be created, also with the time and date appended. Either way, incremental saving never overwrites any existing files.

Quick Save

A quick save is just an option to quickly save your work, by pressing the F4 key on your keyboard.

The quick save feature always saves to dedicated *quick save files*, it never overwrites manual save files or auto save files.

The quick save feature can either create a new quick save file each time, or cycle among a limited number of files. When cycling, the first quick save will save to the file named "Quick Save 1"; the second quick save you perform will save to "Quick Save 2", and so on. When the last quick save file has been saved to, the quick save feature restarts at "Quick Save 1", overwriting previous quick saves.

You can set the number of files to cycle through in the Settings Menu.

Note that you won't be warned or prompted for confirmation when the quick save feature overwrites quick save files. Quick save files are not meant to be permanent. To avoid losing previous work, either allow infinite quick save files, or make regular manual saves.

Auto Save

Candy DC can save your work automatically at specified time intervals.

Automatic saving will save to dedicated auto save files. It will never overwrite manual save or quick save files.

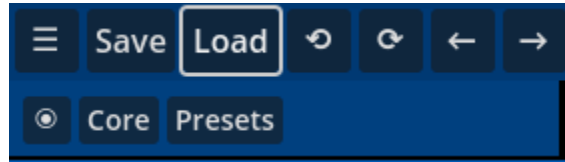

Like with quick saves, it can create an infinite amount of auto saves, or it can cycle through a fixed number of auto save files.

The cycle limit and the time interval can both be configured in the Settings Menu.

Loading

Manual Load

You can manually load a file by clicking the "Load" button at the top of the Main UI:

This will prompt you to select a file to load.

Quick Load

You can load the last quick save by pressing the F5 button on your keyboard.

You will be prompted to confirm that you want to load the last quick save. This will cause you to lose all unsaved work.

The prompt can be disabled in the Settings Menu. However, be mindful that this could result in instant loss of all unsaved work if you ever press the quick load key by error.
