

CANDY DIALOGUE ENGINE

Variables

1.0.0

Dialogue modes determine how dialogue is displayed on screen.

Dialogue modes can be selected in [Candy_Engine.gd](#), in the [dialogue_mode](#) variable. Candy DE provides multiple dialogue modes by default.

Default UI scenes are provided for each mode, and can be customized to fit your needs and preferences.

Custom dialogue modes can also be created and added.

All modes can play voiced dialogues. See the [Voiced Dialogue](#) guide for details.

Dialogue Box

This mode uses a dialogue box, which displays the speaker's name, the spoken text, and optionally a portrait.

Portraits have various settings of their own (see the [Portraits](#) guide for details).

Subtitles

This mode displays only spoken text, although the speaker's name can be optionally added at the start of the spoken text string. It's essentially a lighter form of dialogue box. Despite the name, it doesn't need to be used strictly for subtitles.

Chat Box

This mode displays dialogue in a chat box format, where spoken lines are displayed in a list, with new lines appended at the end. This mode doesn't display a portrait.

Speech Bubbles

This mode displays dialogue in speech bubbles, like comic books. The speaker's name can be optionally added at the start of the spoken text inside the bubble.

Candy DE provides default speech bubbles, where you can easily change the bubble's aesthetic design by swapping to another texture. Variables are also provided to configure the size and placement of speech bubbles, as well as other attributes.

See the [Speech Bubbles](#) guide for details.

Voice Only

This mode only plays voices. It doesn't display the speaker's name, spoken text, or portraits on screen.

Visual Novels

Visual Novel Mode is not a dialogue mode.

Visual Novel Mode consists of displaying character busts (by using §VN commands), while dialogues are displayed through one of the modes listed above.

See the [Visual Novels](#) guide for more information.

Custom Modes

Creating custom modes is just a matter of writing code for them and adding it to a match statement in the engine's core script.

Existing modes can serve as a template to make things easier.

For details, see the [Adding Dialogue Modes](#) guide.
